# PISC™ User Certification

## Build a human firewall with Trained and Tested employees

## Easily verify that every employee is "cyber certified"

▶ ### The Challenge:  People are the weakest link in cyber security

Over 90% of data breaches can be traced to human error.  The problems can be accidental – like a lost laptop – or the result of a malicious attack from the outside.   To properly protect your organization, employees need to be trained on essential information security principles.  But what exactly are the right topics?  And how do you verify that employees and contractors understand them?

▶ ### The Solution:  The PISC Security Awareness training from Information Shield

The **Personal Information Security Certification (PISC)** is a set of ten information security awareness principles (Lessons).   These form a "Common Body of Knowledge" that every computer user must know to protect themselves and their organization.   After the training is complete, employees can take an online test to verify their understanding of the material.

| Your Role in Protecting Information | Protecting Personal Systems |
|---|---|
| Information Classification | Physical Security |
| Secure Access Control | Secure Communications |
| Electronic Mail and Phishing | The role of Security Policies |
| Secure Web Browsing | Reporting Security Incidents |

**The 10 Key Knowledge Domains of the PISC Training**

▶ ### The Bonus:  Integrated with ComplianceShield

Information Shield's security awareness training is delivered as part of the ComplianceShield platform. This allows your organization to integrate training with the rest of employee governance in a simple, integrated interface.
